AI AUTOMATION CANDIDATE ASSESSMENT · IRVAN FAHLEPI

PlacidWay *Social Autopilot*

A production-minded n8n workflow that turns public PlacidWay content into **one on-brand, fact-checked Facebook post per day**, with two layers of guardrails, a human review dashboard, and alerting so nothing fails silently.

n8n 2.44 · 5 workflows | **Claude** writer + independent reviewer | **Facebook Graph API** v26 | **Postgres** store + run log | **22** unit tests

Repository	github.com/Mr-vero/placidway-social-autopilot: importable workflow JSON, README (setup, env vars, how to run, architecture), sample posts
Demo video	5-minute narrated recording on Google Drive. It shows a live run from extraction to the published post on the test Page.
Facebook (test)	PW Autopilot Test (the public test Page) · live posts: Women's Health Screening · Stem Cell Therapy for Autism
Sample output	8 posts generated from real PlacidWay pages, with source URLs (`samples/README.md`). 2 are live on the test Page.

Requirements → implementation

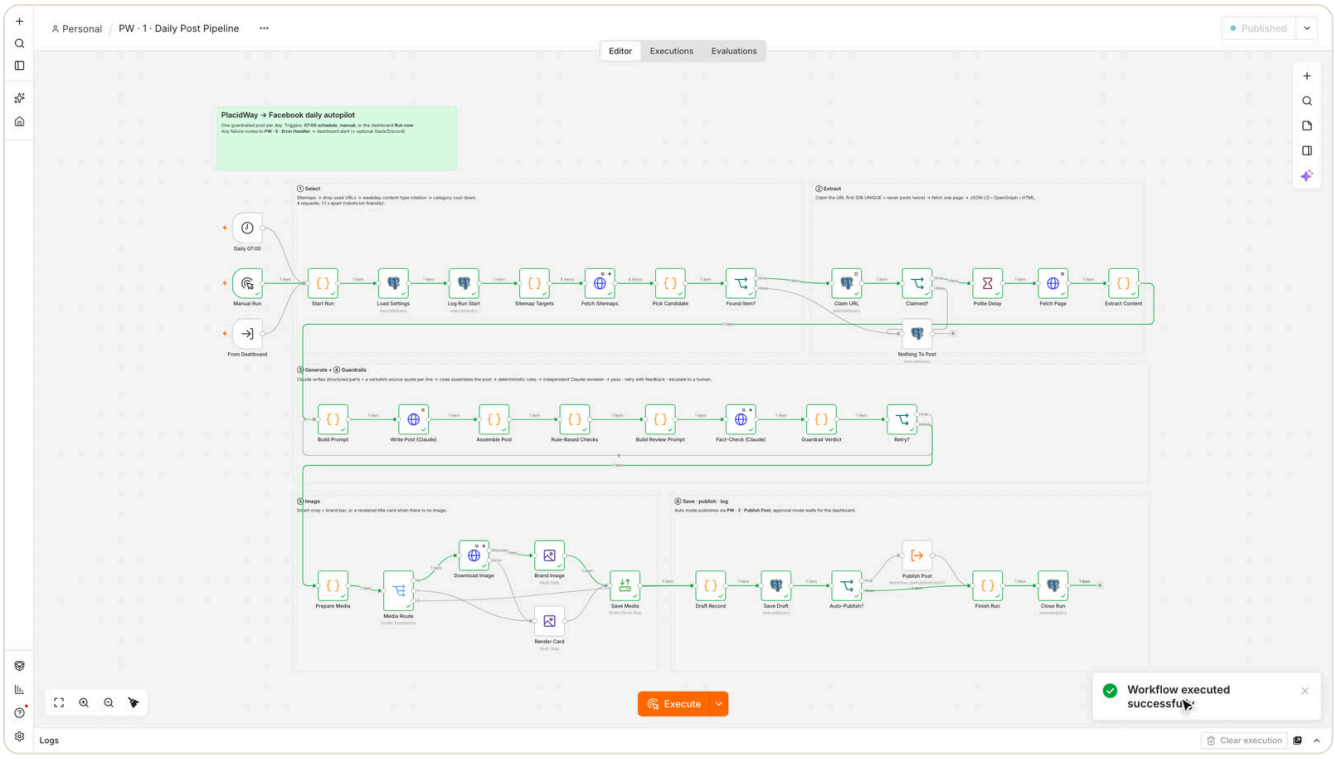

BRIEF	HOW IT'S DONE	STATUS
1 Trigger	Daily 07:00 schedule, manual run, and a dashboard “Run now”	✓ live
2 Extract	Public sitemaps (robots.txt-advertised, ≤ 1 req/s, 5 requests a day), then the page's own JSON-LD with OpenGraph/HTML fallback. Captures title, URL, body, image, listed price	✓ live
3 Select	Weekday content rotation + category cool-down. **UNIQUE(source_url)** in Postgres guarantees a URL is never posted twice	✓ live
4 Generate	Claude returns structured parts (hook, 2–4 lines, CTA, 3–5 hashtags) plus a verbatim source quote per line. Code assembles the post (< 500 chars before the link)	✓ live
5 Guardrails	9 deterministic rules (no medical claims, every number and price must be in the source, quotes must exist on the page…) + an independent Claude reviewer. Failures are rewritten with feedback; after 3 tries they go to a human and never auto-publish	✓ live
6 Publish	Photo uploaded unpublished, then a feed post with the image (immediate or natively scheduled)	✓ live post
7 Review option	`publish_mode = approval | auto`, switchable in the dashboard. Human edits are re-checked against the rules (server returns 422)	✓ live
8 Logging & errors	Every run logs the item, post text, FB post ID and status. Retries + an error workflow raise dashboard alerts with a specific fix	✓ tested

Stretch goals covered: variety rules · branded images (smart crop + brand bar, or a rendered card when there's no image) · review dashboard · engagement read-back · Instagram cross-post path (built; needs an IG Business account to verify).

HOW IT WORKS

The daily pipeline

Schedule / manual → Sitemaps → Pick 1 fresh URL → Claim (UNIQUE) → JSON-LD extract →
Claude writes → Rules + Claude review → Brand image → Approve / auto → Facebook

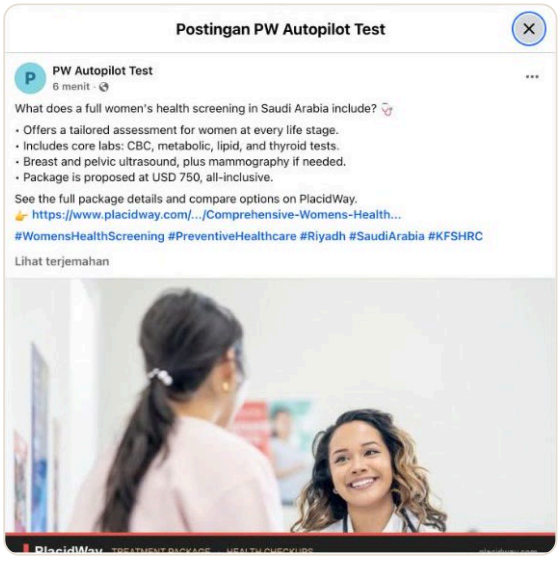

The main n8n workflow after a real run (all green): select · extract · generate + guardrails · image · save and publish.

Verified against the real system

- End-to-end publish to the test Facebook Page, with image and permalink
- Guardrails caught real issues (a number not in the source, an unsupported claim); both were rewritten and passed
- Failures tested live: PlacidWay unreachable, LLM down, invalid Facebook token. Each raised an alert; failed URLs are released for retry
- Dry-run mode records the exact Graph API calls before anything goes live

Key design decisions

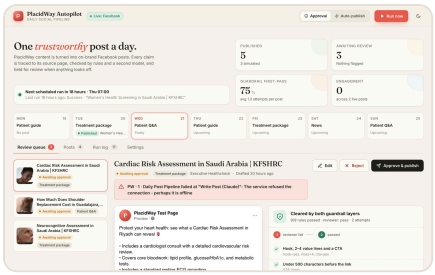

- **The database, not workflow logic,** enforces "never twice"
- **Structured output + code assembly**, so the format is guaranteed and every claim is checkable
- **Fail closed:** if the reviewer is unavailable, the draft goes to a human
- Code-node logic lives in real, unit-tested files; a build step generates the workflows

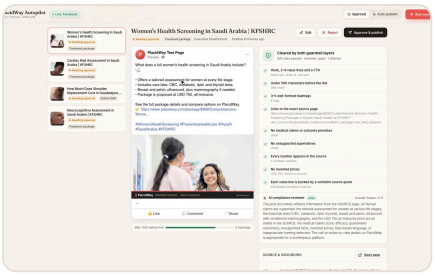

A post generated from a real PlacidWay package page and published live to the test Page ("PW Autopilot Test", not affiliated with PlacidWay). **View it on Facebook →**

WHAT WAS BUILT · SCREENS

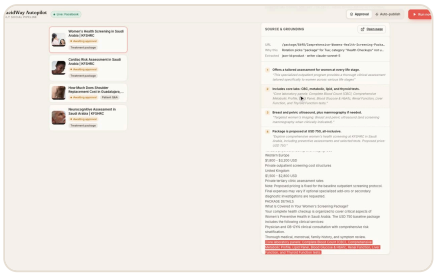

Review dashboard, n8n and outputs

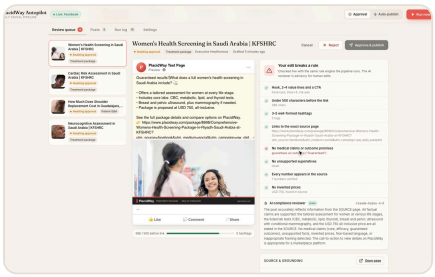

Dashboard: mode switch, Run now, KPIs, weekly rotation

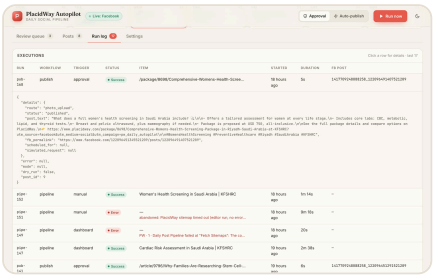

Review queue: Facebook preview + guardrail report

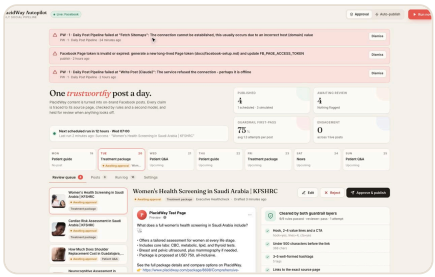

Grounding: each claim's verbatim quote highlighted in the source

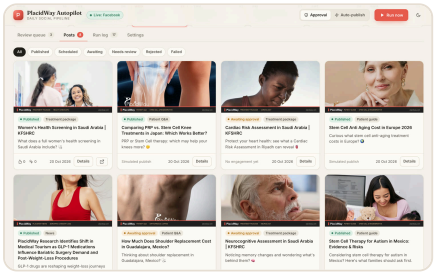

Live checks on edits: "Guaranteed results" → rule fails, approval blocked

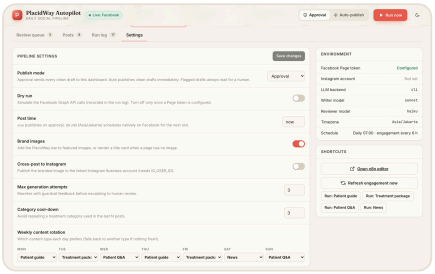

Run log: item, final post text, Facebook post ID, status

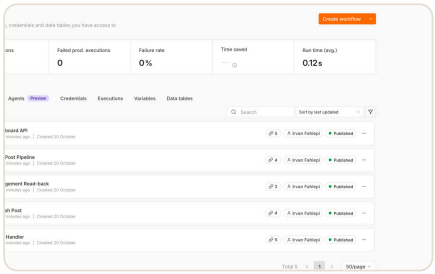

Alerts: site down, LLM down, invalid token, each with a specific fix

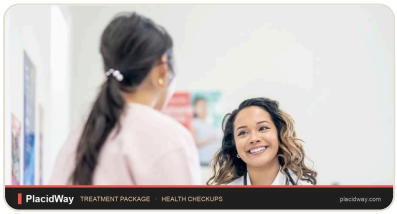

Posts: every draft and outcome, live vs simulated

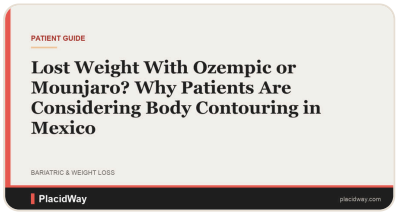

Settings: approval/auto, dry run, scheduling, rotation

n8n: the five published workflows

Branded image: smart crop + brand bar

No image? A title card is rendered

Next for production

Never-expiring system-user token · idempotency check before retrying a publish · queue-mode n8n · prompt examples tuned with marketing · Slack approvals.
